Sold to:	Approvals
Installed at Company:	Approvals
Installed at Address:	Approvals (if any): FM ATEX Other:
City, State, Country:	Hazardous Area: ☐ Class I ☐ Class II/Div 1 ☐ Class II/Div 2
Combustible Material	☐ Undefined/Other:
Has Hazard been tested? \square No \square Yes	Does the hazard need to be contained in the
Can the hazard be exposed to personnel or the atmosphere? \Box	□ No □ Yes ← enclosure? Is it toxic? (i.e. poison, drugs, etc)
Hazard Name:	Example: "Aluminum Dust". "Corn Starch". "Powdered Sugar"
Hazard Type: ☐ Organic ☐ Metal ☐ Other:	
KSt or Su: barg*m/s or cm/s for	Dust → KSt (Deflagration Index) Su ← Gases → Su (Fundamental Burning Velocity)
Pmax: barg	Describe where the KSt or Su value came from. If
Hazard Data Source:	tested in a laboratory, please provide the name & a
Describe the process that we are protecting.	test report. If value is from a reference documents (NFPA or similar), please provide the source.
Describe the Scope of the Design. ◀	for. Example: "The Mill receives bulk product and grinds in down. The Filter Box pulls outside air to transfer the product. The cyclone separates the larger particles from the smaller. The dust collector collectors the smallest fines. The fan on the exhaust of the collector conveys the dust through the system." Describe what is to be protected and what isn't part of the scope. Example: "Customer would like to protection on their milling line which includes the mill, the cyclone, dust collector, and most of the interconnected duct work. The filter box below the mill & fan at the end is not to be protected by Fike."
What is the Protection Objective? ◀	
	Describe how we are going to protect the system. Example: "Mill - designed for containment, inlet has a rotary valve by other & discharge requires chemical isolation. Clean air filter box not protected by Fike. Cyclone — suppression with chemical isolation on inlet and outlet. Discharge has rotary valve by others. Dust Collector — suppression with chemical isolation on inlet. Exhaust outside and not protected by Fike. Discharge has rotary valve by others. Fan not protected by Fike.

Explosion Protection Application Worksheet Enclosure Worksheet Guidance

Enclosure Protection Type (Select One)

Define the method of overpressure protection on the vessel. Only select one method for design.

Suppression

If Suppression, choose Standard SBC agent or Food Grade SBC agent. Venting

Free is for outdoors. Flameless can be indoors.

Vent Ducting

Free vent to direct the deflagration to the outdoors if the duct is less than 20 feet (NFPA). This will increase vent area, require a higher Pred, and/ or may not be possible. Record the length of the duct and any bends for evaluation.

Containment

Enclosure must be able to withstand the deflagration.

Isolation Protection Requirements

Define the type of duct, size, & isolation to be used.

Type

Type of duct being protected (i.e. Inlet, Exhaust, Outlet, Dust Aspiration, Clean Air Inlet, etc.)

Protection

The type of hardware used. (i.e. Chemical Isolation, EIV, EIPV, DFI, Ventex, etc.)

Enclosure Protection Type (Sele	ect one)	Iso	ation Protection Re	equirements

closure if available.

pe of dust required = <35μm, **coarse** = 35μm, fibrous = width ratio)

air which can effect clogging factor, venting efficiency and suppression of metal dusts.

Process Operating Parameters

Operating Pressure & Process Temperature

These values describe the range of conditions inside this enclosure during operation. This is typically not a fan/blower rating.

<u>Ambient Temperature</u>

This is the range of temperature outside the enclosure.

Pred is the maximum allowable pressure can be developed in the enclosure that will result in an acceptable amount of deformation.

Venting Requires a Pred of at least 1.25 PSIG.

Suppression requires a Pred of at least 3.0 PSIG.

FM 7-76 provides guidance when Pred is unknown for vented systems

Verified Pred

Value acquired from the equipment manufacture or from an engineering consultant.

Maximum Safe Fireball Path (venting)

For venting, this value is the shortest distance from the vent opening to any area where personnel, structures, or equipment may be present.

Does the enclosure vibrate/ shake?

The amplitude of movement of the enclosure may require additional hardware to dampen effects on devices/containers.

Is there sight glass ports or windows?

Sight glass ports or windows on the enclosures/ duct work will need to be identified when using Optical Detectors.

Process Layout

Sketch the system layout which includes up to 30' up and down stream of the inlet and exhaust/ outlet. (Include flow direction, duct diameters, bends, interconnected duct, and distances between bends/duct)

Explosion Protection Application Worksheet <u>Hardware Requirements</u>

ONSITE REQUIREMENTS

Is there any site specific PPE required for entry? \square No \square Yes Explain:
Is there any site specific safety training required? $\ \square$ Yes $\ \square$ No
HARDWARE MATERIAL REQUIREMENTS
Is the area susceptible to wash-down or corrosive cleaning chemicals? No Yes Explain:
Does the process enclosure vibrate? (do we need flexible hardware for HRD, PD, & SRD) \Box Yes \Box No
Does the material tend to be sticky or agglomerate? $\ \square$ Yes $\ \square$ No
Does the process have air velocities exceeding 4000 feet/ min (20 m/s)? ☐ No ☐ Yes Explain:
Hardware Options:
Junction Boxes: ☐ Provided by others ☐ Carbon Steel ☐ Stainless Steel
Pressure Detector (if required)
Detector Type: ☐ Ceramic Detector ☐ Hi-Temp SST ☐ Other: ☐
Detector Connection O-Ring Material: PTFE Viton Other:
Detector Options: ☐ Lateral Wye ☐ Air Purge/ Purge Spool
HRD (if required)
Lockout Type: ☐ Standard Slide Gate ☐ Carbon Steel Ball Valve ☐ Stainless Steel Ball Valve
HRD Bolting Pads: ☐ Carbon Steel ☐ Stainless Steel ☐ Other: ☐
HRD Nozzle Cover: ☐ Food Grade Neoprene ☐ Viton ☐ Stainless Steel ☐ Other: ☐
SRD (if required)
Lockout Type: None Carbon Steel Ball Valve Stainless Steel Ball Valve
Fley Hose: Ves No

Explosion Protection Application Worksheet <u>Installation Requirements</u>

INSTALLATION (turnkey or PM only)

What material composition (material & thickness) is the	e duct /e	nclosure /	equipment that we are cutting and welding on?
Describe any special access requirements to get to the	anticipat	ed device	locations.
What will be the anticipated duration of the available s	hutdown	ı? (weekda	y/ weekend/ nights /etc.)
s there confined space entry required? If so, what is th	e plant's	minimum	requirements?
f required, will there be a lift/ scaffolding onsite?	□ No	□ Yes	
Can we use a plasma cutter to cut penetrations?	□ No	□ Yes	Explain:
		□ Yes	Explain:
s there any insulation on the process to be replaced?	□ No	□ Yes	Explain.
If yes, is any of the insulation asbestos?	□ No	□ Yes	
s there dedicated power available for welding/cutting?		□ Yes
