# What's the feature of LED Street Lights:

Energy saving: The system uses LED light sources, intelligent control, and energy management technologies to achieve a significant reduction in energy consumption while ensuring lighting effects.

Intelligent control: Through the integration of sensors, wireless communication cloud computing, and other technologies, the system can achieve intelligent control of street lights, including automatic dimming timing switch, fault alarm, and other functions, which can improve the efficiency and reliability of street light operation.

Information collection: The street lighting system can integrate various environmental perception sensors to collect real-time information such as road surface temperature, humidity, and air quality, providing data support for urban environmental protection and transportation.

Safety guarantee: The street lighting system can monitor and alarm the surrounding
